

m:Ciudad is a Strategic and Singular Project born under the umbrella of the Spanish Technological Platform of Wireless and Mobile Communications ([eMOV](#)), the Spanish national mirror of the eMOBILITY European Technology Platform.

m:Ciudad centres the investigation in key fields for the Spanish sector of mobile and wireless communications. The main goal is to conduct technological research in wireless communications, allowing the mobility / pervasiveness of urban services that are currently delivered by third parties.

In summary, **m:Ciudad proposes a paradigm shift from the *Internet model* to the *Ubiquity model***, where contents, information and services are provided through any channel, to any device, in a customized and secure way.

The Project work is structured in two axes:

The business vision, by the investigation on the market demands of mobile services. This vision is introduced in the project through a set of scenarios.

The Technology vision, that allows for the road map of key-technologies like positioning, Wireless Object Networks, interaction, security and pervasive communications.
